

Prestack Depth Migration and Velocity Model Building

Edited by

Ian F. Jones

Robert I. Bloor

Biondo L. Biondi

John T. Etgen

SEG Geophysics Reprint Series No. 25

Michael A. Pelissier, managing editor

Society of Exploration Geophysicists

The international society of applied geophysics

Tulsa, Oklahoma, U.S.A.

Contents

About the Editors	xxvii
Chapter 1 Introduction	1
References	3
Chapter 2 Migration	5
What is migration?	5
Anisotropy	9
Geometric principles of migration	10
Simplification of the wave equation	12
Integral versus differential methods	13
Sampling considerations and domains of application	14
Regularization	15
Imaging-algorithm requirements and types of regularization	15
References	16
Reprints	17
Systematics of time-migration errors	18
<i>James L. Black and Matthew A. Brzostowski, 1994, GEOPHYSICS, 59, 1419–1434.</i>	
Abstract	18
Introduction	18
Why image rays fail	20
Dipping-layer analysis	22
Constant-gradient analysis	24
Verification on synthetic data	26
Conclusions	27
Acknowledgments	29
References	29
Appendix A: Dipping-layer analysis	30
Appendix B: Constant-gradient analysis	31
Transformation of 3-D prestack data by azimuth moveout (AMO)	34
<i>Biondo Biondi and Nizar Chemingui, 1994, 64th Annual International Meeting, SEG, Expanded Abstracts, 1541–1544.</i>	
Summary	34
Introduction	34

Azimuth moveout operator	35
Coherent partial stacking of a synthetic 3-D land dataset	36
Conclusions	36
Acknowledgments	37
References	37
The time and space formulation of azimuth moveout	38
<i>Sergey B. Fomel and Biondo L. Biondi</i> , 1995, 65th Annual International Meeting, SEG, Expanded Abstracts, 1449–1452.	
Summary	38
Introduction	38
AMO operator in T-X	38
AMO aperture evaluation	39
Conclusions	40
References	40
Regularizing 3-D data sets with DMO	42
<i>Anat Canning and Gerald H. F. Gardner</i> , 1996, <i>GEOPHYSICS</i> , 61 , 1103–1114.	
Abstract	42
Introduction	42
DMO algorithm	43
Inverse DMO	44
Discussion	45
A synthetic example of a point diffractor	47
A 3-D example from a physical model data set	49
Conclusions	50
Acknowledgments	50
References	51
Appendix A: An explicit formula for a DMO filter	51
Appendix B: A verification that the DMO^{-1} algorithm provides an exact inverse of DMO	53
Discussion and reply on “Regularizing 3-D data sets with DMO,” 1997, <i>GEOPHYSICS</i>,	
62, 1331–1332.	54
Acknowledgments	55
References	55
Strike shooting, dip shooting, widepatch shooting — Does prestack depth migration care?	
A model study	57
<i>John Etgen and Carl Regone</i> , 1998, 68th Annual International Meeting, SEG, Expanded Abstracts, 66–69.	
Summary	57
Introduction	57
Model construction	57
3D survey generation	58
Migration results	58
Conclusions	58
References	59

Tutorial: Factors affecting frequency content in preSDM imaging	61
<i>Ian F. Jones and Juergen K. Fruehn, 2003, THE LEADING EDGE, 22, no. 2, 128–134.</i>	
Spurious differences	61
Temporal aliasing	61
Spatial aliasing	62
Wavelet changes during migration	62
Frequency-dependent changes	62
Velocity-dependent changes	62
Offset-dependent changes	64
Kirchhoff migration as a stacking process	64
Sensitivity to velocity error	65
Acquisition footprints	65
Conclusions	66
Suggested reading	66
 Antileakage Fourier transform for seismic data regularization	 67
<i>Sheng Xu, Yu Zhang, Don Pham, and Gilles Lambaré, 2005, GEOPHYSICS, 70, no. 4, V87–V95.</i>	
Abstract	67
Introduction	67
Sampling theory and Fourier basis on regular grid	68
The nonuniform Fourier transform and its inverse	69
Irregularity and nonorthogonality	69
Antileakage Fourier transform	70
Extension to multidimensions	72
Synthetic example	72
Real data applications	72
Discussion and conclusions	74
Acknowledgments	74
References	74
 Chapter 3 Integral Techniques	 77
Traveltime and time-dip computation	78
The imaging step	79
References	79
Reprints	80
 On the imaging of reflectors in the earth	 81
<i>Norman Bleistein, 1987, GEOPHYSICS, 52, 931–942.</i>	
Abstract	81
Introduction	81
Asymptotic inversion operator	84
Application to Kirchhoff data	85
Determination of θ and c_+	87
Implementation	88
Conclusions	89
Acknowledgments	89
References	89
Appendix A: Analysis of the stationary phase conditions	89

Appendix B: Matrix signature	91
Appendix C: Relation between $h(x, \xi)$ and $\det [\Phi_{\xi\sigma}]$ at the stationary point	92
Gaussian beam migration	93
<i>N. Ross Hill</i> , 1990, <i>GEOPHYSICS</i> , 55 , 1416–1428.	
Abstract	93
Introduction	93
The Gaussian-beam asymptotic solution to the wave equation	94
Downward continuation using Gaussian beams	95
Applications	98
Discussion and conclusions	103
Acknowledgments	104
References	104
Appendix: Summing shifted Gaussian functions	105
Upwind finite-difference calculation of seismic traveltimes	106
<i>Jos van Trier and William W. Symes</i> , 1990, 60th Annual International Meeting, SEG, Expanded Abstracts, 1000–1003.	
Summary	106
Introduction	106
Eikonal equation	106
Finite-difference scheme	107
Example	107
Limitations	108
Conclusions	108
References	108
Frequency-selective design of the Kirchhoff migration operator	110
<i>Samuel H. Gray</i> , 1992, <i>Geophysical Prospecting</i> , 40 , 565–572.	
Abstract	110
Introduction	110
Modifying the Kirchhoff migration operator	112
An example	114
Conclusions	116
References	116
Finite-difference computation of multivalued traveltimes	117
<i>Pascal Podvin</i> , 1992, 54th Annual Conference and Exhibition, EAEG, Extended Abstracts, 502–503.	
Computation of reflected arrivals	117
Multivalued traveltimes without a priori information	117
References	118
3-D true-amplitude finite-offset migration	119
<i>Jörg Schleicher, Martin Tygel, and Peter Hubral</i> , 1993, <i>GEOPHYSICS</i> , 58 , 1112–1126.	
Abstract	119
Introduction	119
True-amplitude migration theory	122
True-amplitude migration procedure	127
Conclusions	128
Acknowledgments	129
References	129

Appendix A: Measurement configurations	130
Appendix B: Weight function	131
Appendix C: Phase shift due to caustics	133
Kirchhoff migration using eikonal equation traveltimes	134
<i>Samuel H. Gray and William P. May, 1994, GEOPHYSICS, 59, 810–817.</i>	
Abstract	134
Introduction	134
The migration comparison	135
A hybrid eikonal equation solver	137
Conclusions	139
Acknowledgments	139
References	139
Appendix: <i>F-X</i> migration and Kirchhoff migration	140
Anti-aliased Kirchhoff 3-D migration	142
<i>David E. Lumley, Jon F. Claerbout, and Dimitri Bevc, 1994, 64th Annual International Meeting, SEG, Expanded Abstracts, 1282–1285.</i>	
Summary	142
Introduction	142
Anti-aliasing theory	143
Anti-alias filter design	144
Data examples	145
Conclusions	145
Acknowledgments	145
References	145
Maximum energy traveltimes calculated in the seismic frequency band	146

3D V(Z) Prestack migration — An alternative to conventional processing	157
<i>John Etgen, Walter Rietveld, and Rusty Alford, 1997, 59th Annual Conference and Exhibition, EAGE, Extended Abstracts, Session A045.</i>	
Introduction	157
Method	157
Example and discussion	157
Conclusions	158
References	158
Fast and accurate finite-difference solutions of the 3D eikonal equation parametrized in celerity	159
<i>A. Pica, 1997, 67th Annual International Meeting, SEG, Expanded Abstracts, 1774–1777.</i>	
Summary	159
Introduction	159

3D eikonal resolution scheme	159
Geophysical properties of the method	160
Conclusion	161
References	161
The equivalent offset method of prestack time migration	163
<i>John C. Bancroft, Hugh D. Geiger, and Gary F. Margrave, 1998, GEOPHYSICS, 63, 2042–2053.</i>	
Abstract	163
Introduction	163
Kirchhoff migration concepts	164
Equivalent offset migration (EOM)	165
Examples	169
Conclusions	171
Acknowledgments	173
References	173
Appendix: Derivation of the equivalent offset equation (7)	174
Antialiasing methods in Kirchhoff migration	175
<i>Ray Abma, James Sun, and Nick Bernitsas, 1999, GEOPHYSICS, 64, 1783–1792.</i>	
Abstract	175
Introduction	175
Migration antialiasing frequency limits	177
Migration antialiasing by simple operator truncation	179
Comparisons of Gray's and triangle antialiasing	179
Conclusions	183
Acknowledgments	183
References	183
Appendix A: The spatial derivative of the 3-D migration operator	184
Equalised prestack depth migration	
<i>Robert Bloor, Uwe Albertin, Herman Jaramillo, and Dave Yingst, 1999, 69th Annual International Meeting, SEG, Expanded Abstracts, 1362–1365.</i>	
Summary	185
Introduction	185
Equalisation	185
Implementation and application	186
Conclusions	186
References	186
Prestack Gaussian-beam depth migration	189
<i>N. Ross Hill, 2001, GEOPHYSICS, 66, 1240–1250.</i>	
Abstract	189
Introduction	189
Theory	190
Computations	194
Results	195
Discussion and conclusions	196
Acknowledgments	197
References	197
Appendix A: Gaussian beams	198
Appendix B: Representation of a point source by Gaussian beam summation	198

Common-angle migration: A strategy for imaging complex media	200
<i>Sheng Xu, Hervé Chauris, Gilles Lambaré, and Mark Noble, 2001, GEOPHYSICS, 66, 1877–1894.</i>	
Abstract	200
Introduction	200
Asymptotic linear forward modeling	201
Migration/inversion of single-fold data sets with multiple arrivals	202
Canonical test case	206
Common-diffracting-angle migration/inversion	208
Application to Marmousi	210
Conclusion	211
Acknowledgments	214
References	214
Appendix A: Local differential representation of TIC	216
Appendix B: Demonstration of condition $\frac{\partial \zeta}{\partial \sigma} _{x\gamma} \neq 0$	216
 Gaussian beam migration of common-shot records	 218
<i>Samuel H. Gray, 2005, GEOPHYSICS, 70, no. 4, S71–S77.</i>	
Abstract	218
Introduction	218
Poststack Gaussian beam migration and a straightforward prestack extension	219
Common-offset and common-shot Gaussian beam migration	220
Examples	222
Conclusions	224
Acknowledgments	224

Velocity and subsurface geometry inversion by a parameter estimation in complex inhomogeneous media	540
<i>P. M. van der Made, P. van Riel, and A. J. Berkhout, 1984, 54th Annual International Meeting, SEG, Expanded Abstracts, 373–376.</i>	
Introduction	540
A procedure for subsurface inversion by parameter estimation	540
Inversion by parameter estimation: Properties	540
Conclusion	542
References	542
Tomographic determination of velocity and depth in laterally varying media	543
<i>T. N. Bishop, K. P. Bube, R. T. Cutler, R. T. Langan, P. L. Love, J. R. Resnick, R. T. Shuey, D. A. Spindler, and H. W. Wyld, 1985, GEOPHYSICS, 50, 903–923.</i>	
Abstract	543
Introduction	543
Problem formulation	544
Inversion algorithm	545
The effects of limited-angle rays — Undetermined and poorly determined model features	547
Conventional and tomographic processing of a seismic line over a permafrost body	549
Conclusion	555
Acknowledgments	555
References	559
Appendix A: Method of tracing rays	559
Appendix B: Calculation of slowness and depth derivatives	560
Appendix C: Determined and undetermined quantities	561
Inversion with a grain of salt	564
<i>Larry R. Lines and Sven Treitel, 1985, GEOPHYSICS, 50, 99–109.</i>	
Abstract	564
Motivation for sensitivity analysis	564
Computation of extremal solutions for least-squares problems	565
An extremal solution for traveltimes inversion of offset VSP recordings	567
Conclusions	571
References	571
Appendix A: The edgehog solution	572
Appendix B: The “most-squares” method	573

Tomographic determination of interval velocities from picked reflection seismic data	575
<i>Charles H. Sword Jr.</i> , 1986, 56th Annual International Meeting, SEG, Expanded Abstracts, 657–660.	
Picking by controlled directional reception	575
The objective function	575
Minimizing the objective function	576
Results of tests on synthetic data	576
Conclusions	577
Acknowledgments	577
